Dear Rubrik Hiring Team,

I'm Gyana Ranjan Sahoo, a final-year B.Tech Computer Engineering student at Siksha 'O' Anusandhan (ITER), graduating in July 2027. I'm applying for the **Platform Security Engineering** role because I want to build systems that stay safe when things go wrong, and the work on Shield Platform, from access control to AI agent security, is the kind of problem I want to grow into.

My foundation is Java, Python and TypeScript, with strong fundamentals in data structures, algorithms, OOP, operating systems and networks. In my projects I've worked with the parts of a system that protect users. In **App Forge**, a four-microservice platform on AWS, I secured the services with Clerk authentication and a Prisma/PostgreSQL data layer. In **Freshly**, a cross-platform app, I built a REST API with Clerk authentication and secure token storage. I containerized these services with Docker and automated their CI/CD with GitHub Actions. I also work on Linux and use Git every day.

I use **Claude Code** as part of my daily workflow, and I built App Forge to stream LLM-generated code into a live preview. That has taught me why AI-generated code needs the same scrutiny as any other contribution, which is the mindset your team describes. I'm also certified in Generative AI Systems.

I haven't used Go professionally. I picked up TypeScript and Node.js through projects, and I'm ready to learn Go quickly with the help of your mentors. I'm curious about how systems break, I pay attention to details, and I ask questions when something is unclear.

My resume is attached, and my code is on GitHub (github.com/gyana-rj). I'd welcome the chance to talk about the role. Thank you for your time.

Sincerely,

Gyana Ranjan Sahoo
